

Determinatives as nouns in English

Brett Reynolds ^{*}

Humber Polytechnic & University of Toronto

Draft, September 2026

Abstract

I argue that English determinatives belong within Noun, provisionally as a fourth coordinate subcategory alongside common nouns, proper nouns and pronouns. The argument extends the grounds on which *The Cambridge grammar of the English language* already includes pronouns despite their distinctive inflection and restricted dependents. Independent uses, number, genitives, partitives and modification support a shared nominal profile. As nouns, determinatives inherit the nominal structure for heading NPs, with lexical and constructional restrictions preserved, including those of articles. A matched grammatical fragment compares this analysis with separate-D grammars using ordinary heads or fusion. The taxonomic choice concerns inheritance through Noun versus projection licensed across separate noun and determinative categories.

Keywords: determinatives, nouns, lexical categories, noun phrases, English

I THE QUESTION

What is the categorial relationship among words such as *some*, *me*, *apple* and *Brett*? I argue that all four are nouns. I call this the DETERMINATIVE-NOUN or D-NOUN ANALYSIS.

I adopt the general framework of *The Cambridge grammar of the English language* (CGEL; Huddleston and Pullum 2002). Unlike CGEL, though, I include determinatives within Noun. The claims concern synchronic English lexical categories.

I use DETERMINATIVE for the category containing articles, demonstratives and quantifiers such as *the*, *this*, *some*, *every* and *many*.¹ I reserve DETERMINER for a syntactic function within the noun phrase. This distinction separates what kind of word *some* is from what syntactic relationships its phrase participates in. Capitalized Noun names the proposed superordinate category containing common nouns, proper nouns, pronouns and determinative nouns.

CGEL already places common nouns, proper nouns and pronouns within Noun. It expressly justifies pronoun membership by the functions of pronoun-headed phrases, despite differences in inflection and dependents (Huddleston & Pullum, 2002, pp. 327–328). The question here is whether

^{*}Contact: brett.reynolds@humber.ca

¹For a fuller inventory, see the online “[List of determinatives in English](#)” accompanying Huddleston et al. (2022).

determinatives meet comparable grounds for inclusion. Differences from common nouns alone can't settle that question: the accepted noun subcategories already differ from one another. The inclusion of auxiliaries within Verb supplies a precedent for this kind of extension: a closed category can retain its distinctive syntax within a broader lexical category (Pullum & Wilson, 1977).

In the D-noun analysis, determinatives inherit the nominal projection rules of Noun. A determinative heads a NOMINAL (Nom), which heads an NP. Nom contains the head and its internal dependents, excluding an external determiner. Lexical restrictions govern which uses are available. The placement of determinative alongside pronoun is a further proposal, assessed in §5.

Figure 1 compares *CGEL* with the D-noun analysis for *take some apples* and *take some*. Both keep *some* in one lexical category across uses. In *CGEL*, independent *some* jointly fills determiner and head functions, a FUSION OF FUNCTIONS (Huddleston & Pullum, 2002, pp. 410–412). In the D-noun analysis, *some* heads its own NP through a Nom in both uses.

Here DP abbreviates DETERMINATIVE PHRASE, as in *CGEL*. It differs from the DP of the DP hypothesis, where D heads the whole expression *some apples* (Abney, 1987). The D-noun analysis keeps *apples* as that expression's ultimate head.

Earlier unifications include Palmer's grouping of determinatives with pronouns against the traditional adjectival classification, Postal's underlying article analysis of pronouns, and Sommerstein's underlying NP analysis of articles and pronouns (Palmer, 1924; Postal, 1966; Sommerstein, 1972). Hudson places the words he calls determiners within pronoun and pronoun within noun (Hudson, 2004, 2010). Section 2.2 compares these proposals; Table 1 locates the taxonomic alternatives.

I first distinguish the competing analyses, then establish what the existing noun subcategories share and how determinatives compare. Independent uses, partitives and modification identify the constructions to be explained. The matched fragment in §7.2 holds the judgments and lexical restrictions fixed while varying taxonomy and headedness.

2 CLASSIFICATION, HEADEDNESS AND FUNCTION

2.1 CATEGORY, FUNCTION AND PHRASE STRUCTURE

Lexical categories and syntactic functions cut across one another. An NP can function as determiner, as in *Kim's book*, and a determinative-headed phrase can function as modifier, as in *the many people* (Payne et al., 2010; Pullum & Miller, 2022). Including determinatives within Noun preserves this distinction: the NP headed by *some* functions as determiner in *take some apples* and as object in *take some* (Figure 1).

The question of lexical classification is distinct from the headedness question associated with the DP hypothesis of Abney (1987). Under that hypothesis, D heads expressions such as *some apples*. I retain noun-headed NPs and reject the DP analysis for English, following the arguments of Pullum and Miller (2022) and Bruening (2020).

Category membership doesn't remove lexical restrictions. *Every apple* is grammatical, but **I'll take every* isn't an ordinary way to accept apples. Making *every* a noun doesn't give it the full range of uses available to *some*. Section 7.2 states structural rules and lexical restrictions separately so their contributions can be assessed.

2.2 TAXONOMIC AND STRUCTURAL ALTERNATIVES

Keeping a word in one category across dependent and independent uses leaves its taxonomic position open. As J. Lyons (1968, pp. 232–235) observes, distribution can be compared at different levels of

CGEL*D-noun analysis*

Figure 1: *Take some apples* (left) and *take some* (right) under *CGEL* (top) and the D-noun analysis (bottom). In the upper-right tree, DP fills Det of NP and Head of Nom. In the lower pair, *some* heads an NP through the same nominal projection; that NP functions as Det on the left and Obj on the right. Function labels appear above category labels. Det marks determiner, Obj object, and Det-Head fusion; the two links show the combined functions. N, D and V mark noun, determinative and verb; NP, DP and VP mark their phrases. Subscripts identify noun subcategories.

categorization: two expressions may belong together at one level and differ at a more specific level. Table 1 sets out selected arrangements, from three separate primary categories to successive inclusion. Common and proper nouns remain within Noun throughout. The D-noun analysis differs from *CGEL* by including determinative within Noun, and from Hudson by placing it alongside pronoun.

Table 1: Selected taxonomic arrangements. Noun contains common and proper nouns in every row; its other members vary. The Hudson row abstracts from differences in lexical inventory explained in the text.

Relation among Noun, pronoun and determinative	Account or status
Noun, pronoun and determinative are separate primary categories.	Logical comparison
Pronoun is within Noun; determinative is a separate primary category.	<i>CGEL</i>
Determinative is within Noun; pronoun is a separate primary category.	Logical comparison
Pronoun and determinative are coordinate subcategories of Noun.	D-noun analysis
Determinatives belong within pronoun, which is within Noun.	Hudson
Pronoun is within determinative, which is within Noun.	Reverse nesting for comparison

Palmer (1924, p. 24) proposed placing determinatives with pronouns, citing disagreement about their classification and most members' ability to "be used indifferently as pronouns or as modifiers of nouns". J. Lyons (1968, p. 279) also emphasizes the shared definiteness and deictic contrasts of articles, demonstratives and personal pronouns. The D-noun analysis retains determinatives and pronouns as distinct subcategories of Noun.

Hudson includes the determining words within pronoun. His noun category has the subcategories common noun, proper noun and pronoun (Hudson, 2010, pp. 253–254). In his terminology, a determiner is a pronoun whose VALENCY permits the relevant common-noun dependent (Hudson, 2004, pp. 9–10). Identifying these words by their permitted dependents doesn't require another category node.

CGEL and Hudson classify different inventories. Hudson's criteria in the 2004 paper centre on licensing a singular count common noun and on mutual exclusion in that use. He sets aside *all*, cardinal numerals and quantifiers restricted to plural or non-count nouns. *CGEL*'s determinative category is broader, so the comparison requires checking which words and constructions each covers.

Anderson (1997) draws the boundary of the nominal category differently. He groups names, pronouns and determining words as a notional {N} category, with common nouns represented separately. His {N} differs from the inclusive Noun proposed here and falls outside Table 1.

Taxonomic inclusion doesn't settle the structural analysis. Hudson separates dependency from phrase headedness: his 2004 account permits mutual dependency between determiner and common noun, with different constructions selecting different external heads (Hudson, 2004, pp. 7–9). In

We met that day, the temporal adjunct depends on the temporal meaning of *day*. Such restrictions support a common-noun head for temporal adjuncts (Hudson, 2004, pp. 10–12).

Other unifications concern underlying representation. Postal (1966) unifies personal pronouns and articles through an underlying article analysis. Sommerstein (1972, pp. 197–203) reverses the direction, assigning underlying NP structure to the definite article and personal pronouns, with relative-clause structures contributing further descriptive material. These structures don't by themselves place the surface lexical categories in Table 1. Déchaine and Wiltschko (2002) distinguish pro-DP, pro- ϕ P and pro-NP, connecting different pronominal projections with distribution and binding. Their proposal adds differences in pronominal projection to the comparison.

Rejecting a separate primary D needn't preserve a unified determinative subcategory. Spinillo (2004) proposes redistribution among existing categories, retaining *the*, *a* and *every* as an expanded article category. That proposal makes the restricted members a separate category; the D-noun analysis retains them inside the wider determinative subcategory.

For demonstratives and forms such as *some* and *all*, Spinillo (2004, pp. 140–144) rejects switching between determiner and pronoun categories according to whether a noun follows. She compares the alternation with verbs and prepositions used with or without a complement. The D-noun analysis agrees that the two uses needn't involve different lexical categories. It differs in retaining determinative as the subcategory across those uses.

Van Eynde (2003) likewise rejects a separate determiner category, but assigns determining expressions to adjective or noun on morphological and agreement evidence, chiefly from Italian and Dutch. His analysis separates lexical category from the features governing determination. A noun-headed NP account therefore needn't unify every determining expression as nominal.

Independent nominal use may support inclusion within Noun without selecting the pronoun subcategory. The demonstratives' deictic properties make a pronominal grouping plausible; the question is how far that grouping captures the wider inventory's syntax. The comparisons below address modifier profiles (§3.3), the determinative–pronoun boundary (§5), and the positive connections linking restricted *every* to other quantifiers (§6). Redistribution must be assessed against those connections as well as independence. The starting point is *CGEL*'s existing grounds for including distinct subcategories within Noun.

3 THE D-NOUN ANALYSIS

3.1 THE EXISTING STANDARD OF NOUNHOOD

The starting category is Noun as *CGEL* already constitutes it. Its discussion of pronouns makes the reasoning explicit: they differ from prototypical nouns in inflection and permitted dependents, but qualify because the phrases they head have the functions of common- and proper-noun-headed phrases (Huddleston & Pullum, 2002, p. 327). Table 2 compares the variation already accepted within that category with the proposed determinative extension.

Table 2: Typical profiles of *CGEL*'s three noun subcategories and the proposed fourth. Each has further lexical and constructional restrictions (Huddleston & Pullum, 2002, pp. 327–328, 373, 415–424, 425–430, 517–520). The text develops the genitive comparison.

Dimension	Common noun	Proper noun	Pronoun	Determinative
Inventory	Open	Open to new names	Closed	Closed
Morphology	Number and genitive	Genitive; restricted plurals	Personal-pronoun case paradigms	Demonstrative number; genitive-marked personal compounds
Determination	Broad contrasts; singular count arguments normally require it	Restricted in primary naming uses	Normally excluded	Lexically restricted; <i>the few, these three</i>
Internal modification	Productive AdjP and nominal modification	Restricted embellishments	Restricted: <i>poor old me</i>	Restricted adverb premodifiers and nominal postmodifiers

Common nouns supply the most familiar profile, but they don't supply an entry test that every noun subcategory has to pass unchanged. Pronouns remain nouns despite their closed inventory and restricted modification; proper nouns remain nouns despite their distinct naming uses. An argument that excludes determinatives on these grounds therefore needs to explain why comparable differences warrant a primary-category boundary in this case.

Meaning and reference also vary within Noun. *Apple* conveys a descriptive classification; *Kim*, in its primary naming use, identifies through a name; *she* supplies limited descriptive content and depends on context. The quantificational or deictic contribution of a determinative therefore needs to be assessed alongside its grammar, rather than measured against common-noun semantics alone.

The distributional comparison follows *CGEL*'s pronoun argument: a range of determinatives occurs in subject, object and complement-of-preposition positions without another overt nominal head. The pattern recurs across lexemes and appropriate contexts, establishing systematic nominal use. The examples in §4.1 compare all four proposed subcategories in the same positions.

External distribution alone is insufficient: adjectival constructions such as *the rich* also fill those positions. The further comparison concerns the breadth of independent use, number, determination, partitives and internal modification. Together these properties support a nominal subcategory profile. Restrictions on particular lexemes or readings remain part of the description, just as they do within the existing Noun category; §4.6 examines the predicative restrictions.

Extending the analysis to restricted members carries a separate burden. Pronoun forms themselves don't all pass the argument-position test: dependent genitives such as *my* have positive support from their paradigms. For determinatives, the argument likewise needs to establish both a broadly

nominal constructional profile and the restricted members' integration into that category. Section 6 supplies the latter argument.

The distinction at issue is thus one of taxonomic level. A closed inventory, reduced descriptive content or unusual modifier selection can establish a distinctive subcategory without establishing exclusion from Noun. The decisive comparison is whether the shared nominal behaviour and local differences are better captured by extending existing nominal structure or by preserving a separate primary D. Section 7.2 holds the lexical restrictions fixed to make that comparison explicit.

The D-noun analysis captures shared properties through INHERITANCE: a property stated for a superordinate category is available to its subcategories, subject to stated restrictions. Determinatives therefore inherit nominal projection from Noun. Subcategory rules constrain combinatorics, and lexical entries distinguish such forms as independent *some* and dependent-only *every*.

3.2 NOUN PHRASES IN DETERMINER AND ARGUMENT FUNCTIONS

Determiner function already cuts across the existing noun subcategories. Compare *my book*, *Kim's book* and *the king's book*. The determiner is an NP ultimately headed by a pronoun, a proper noun and a common noun respectively (Huddleston & Pullum, 2002, pp. 354–355, 470–471).² In the last example, *the* determines *king* inside the genitive NP, while that whole NP determines *book*. Figure 2 illustrates the proper-noun case: *Kim's* fills Det, while *book* ultimately heads the larger NP.

Figure 2: The genitive NP *Kim's* functions as determiner within *Kim's book*, ultimately headed by *book*. The representation abstracts from the internal realization of genitive marking.

The compound determinative joins this pattern in *someone's book*: its genitive NP fills the same determiner function. The nominal base in *someone* may contribute to that permission; it doesn't establish genitive marking throughout determinative.

The inherited projection gives the two D-noun structures in Figure 1. In *take some apples*, the NP headed by *some* fills Det, as *Kim's* does in *Kim's book*; *apples* heads the larger NP. In *take some*, *some* heads the whole object NP. The lexeme retains its subcategory and nominal projection across these uses, while the NP it heads changes function.

²CGEL assigns these genitives the combined function Subject–Det (Huddleston & Pullum, 2002, pp. 472–473). I treat them as Det here, without the additional subject function.

Shared projection doesn't imply unrestricted interchangeability. The determiner construction selects a determinative-headed phrase, a suitable genitive NP, or another licensed expression. Number, countability and other selectional conditions further distinguish the determining expressions. Section 7.2 includes these restrictions in the comparison of grammars.

3.3 MODIFIER SELECTION AND TAXONOMIC LEVEL

Shared nominal projection doesn't make modifier permissions uniform. In *almost every experienced teacher* (Figure 3), the AdvP *almost* modifies the determinative noun *every*; the AdjP *experienced* modifies the common noun *teacher*, which ultimately heads the outer NP.

Figure 3: Two modifier relations in *almost every experienced teacher*: *almost* modifies *every*, and *experienced* modifies *teacher*. The outer NP has *teacher* as its ultimate head. Internal structure within the one-word modifier phrases is suppressed.

Payne et al. (2010, pp. 40–42) defend keeping *few*, *any* and related forms in one lexical category across dependent and independent uses. In *hardly any money* and independent *hardly any*, *hardly* remains an adverb and *any* retains its category. The D-noun analysis preserves that continuity. It also preserves their contrast between adverbial premodification, as in *almost anybody*, and adjectival postmodification, as in *nothing absolute*.

Payne et al. (2010, pp. 60–61) also argue that distribution alone can't decide whether adjectives and adverbs are inflectional variants of one category or derivationally related members of different categories. The D-noun analysis preserves distinct lexical subcategories and makes no inflectional-variant claim. Their methodological constraint still applies: shared positions alone don't settle category status.

Modifier selection supports distinguishing determinatives from pronouns and common nouns. The further question is the taxonomic level of that distinction. Within the proposed Noun, the determinative subcategory licenses *hardly any* and *almost every*; the common-noun subcategory licenses *experienced teacher*. Neither **experienced every* nor **almost teacher* follows. The existing modifier profiles remain, while their relation to the broader category changes; §7.3 considers the cost explicitly. Section 4 assesses the fuller constructional profile against the grounds on which *CGEL* already includes distinct subcategories within Noun.

4 EVIDENCE FOR NOMINAL STRUCTURE

Independent uses, partitives and modification show a recurring nominal pattern. These observations overlap: *Some left* illustrates both external distribution and syntactic completeness. Fusion and ordinary headedness can cover this pattern. The comparisons below distinguish the shared observations from the analyses of their internal structure; §7.2 assesses the resulting organization of the grammar.

4.1 BREADTH OF INDEPENDENT USE

Independent use is widespread within the determinative inventory. *CGEL* discusses such uses for demonstratives and quantifiers including *some, all, both, many, few, several, each, either, neither, much* and *enough*, while recording lexical restrictions and the separate forms *no/none* (Huddleston & Pullum, 2002, pp. 371–372, 410–424). The generalization concerns the availability of independent constructions across a lexical category, not unrestricted acceptability in every sentence frame.³

The pattern extends beyond a few compounds or a single lexicalized expression. For this closed category, PRODUCTIVITY concerns the availability of independent use among established members under appropriate conditions, rather than the licensing of new lexical items.

In the constructed examples in (1), compare the positions occupied by the bracketed NPs: subject, object and complement of a preposition. Assume that a woman named Kim and a group of people are already under discussion. These positions admit NPs containing words from each proposed noun subcategory; the competing analyses assign different internal structures to independent *some*.

- (1) a. [*People*] left. I see [*people*]. with [*people*]
 b. [*Kim*] left. I see [*Kim*]. with [*Kim*]
 c. [*She*] left. I see [*her*]. with [*her*]
 d. [*Some*] left. I see [*some*]. with [*some*]

Adjectival independent uses prevent a simple inference from these positions to nounhood. *The rich* and *the poor* can fill nominal argument positions. Comparative and superlative adjectives also head expressions without a human-class interpretation: *CGEL*'s *the most important of her criticisms* is an NP containing a partitive *of*-phrase (Huddleston & Pullum, 2002, pp. 332–333, 416–423).

Independent *some* can form a one-word NP, whereas an NP with *rich* as fused head normally requires a determiner on the human-class reading. That is a local contrast: argument NPs headed by singular count common nouns also need determination. Section 4.4 returns to the fuller adjectival comparison.

4.2 STRUCTURAL SATURATION AND INTERPRETATION

With a group of people under discussion, *Some left*, *Many came* and *All agree* illustrate STRUCTURAL SATURATION: an argument expression can be syntactically complete without another overt head

³Material before a determiner falls outside the independent-use comparison. *CGEL* treats *all/both* in *all/both the books* as predeterminer modifiers, *quite/rather* before *a good idea* as peripheral modifiers, and *such/exclamative what* before *a disaster* as adjectives (Huddleston & Pullum, 2002, pp. 433–437). The fixed *many a* is a complex determinative restricted to Det function (Huddleston & Pullum, 2002, p. 394). The *half* in *half a cake* is a common noun used as a predeterminer modifier (Huddleston & Pullum, 2002, p. 434). These constructions don't add evidence for independent determinative heads.

or determiner. Syntactic completeness differs from contextual interpretation. In *I'll take some*, the relevant substance or set may be supplied by discourse or the situation. That dependence doesn't establish a deleted common noun: ordinary pronouns also depend on context.

In the following attestation from the CGELBank treebank, *two different Honda models* supplies the domain for the independent object *both*:⁴

- (2) *Went there yesterday: we are trying to decide between two different Honda models, so we wanted to test-drive both back to back.*

Generalizing expressions such as *Many are called, few are chosen* and *Enough is enough* need no previously uttered common-noun phrase. They rule out a mandatory overt-antecedent requirement, but a silent-noun account could supply a generic restriction. Such examples don't decide whether the restriction belongs in semantics or syntax.

The comparison with ordinary pronouns and proper nouns is structural as well as interpretive. In *She left* and *Kim left*, *CGEL* permits an NP headed by a nominal with no determiner. Applying that structure to *Some left* preserves the same division between a complete NP and its context-dependent reference. The dependent use of *some* doesn't by itself require a Det function inside every independent occurrence.

Fusion supplies the competing analysis. In Payne et al. (2007), one constituent jointly realizes Head and a dependent function, subject to structural and adjacency conditions. In *CGEL*'s analysis of independent *some*, the DP headed by *some* fills Det of NP and Head of Nom. The word retains the determinative category it has in *some apples*, while the independent expression is an NP. Ordinary headedness replaces this relation with nominal projection; lexical restrictions on independence and form selection remain.

CGEL also uses fusion in noun-headed structures. It analyses *mine* as fused Det–Head when it stands for a possessed entity in an anaphoric context, but as pure Head in the predicative possessive use *it's mine* (Huddleston & Pullum, 2002, pp. 410–411).

Saturation therefore clarifies the distributional comparison without independently selecting either internal structure.

4.3 PARTITIVES LOCATE THE QUANTIFICATIONAL HEAD

In *some of the wine*, *some* specifies a quantity drawn from an identifiable amount of wine. The NP *the wine* denotes the partitive DOMAIN: the whole from which that quantity is drawn. This NP is complement of *of*. A pronoun-headed NP or independent genitive NP can express the domain too: *many of them*, referring to previously mentioned people, or *some of Kim's*, referring to Kim's apples.

Compare where the common noun occurs in *some apples* and *some of the wine*. In the partitive, *wine* is embedded inside the *of*-phrase, so it can't be the lexical head of the whole NP. The comparison instead concerns the head-like role of *some* in that larger expression.

Figure 4 gives the D-noun analysis, with the *of*-phrase functioning as complement within Nom, as in *CGEL*'s partitive tree (Huddleston & Pullum, 2002, pp. 411–412). *CGEL* represents the head-like role of *some* through Det–Head fusion. Partitives support that role while leaving the choice between fusion and ordinary headedness open.

⁴CGELBank (Reynolds et al., 2023), sentence reviews-083459-0002.

Figure 4: *Some of the wine* under the D-noun analysis. The Head relations lead from the outer NP to *some*. The common noun *wine* is inside the complement PP and doesn't head the whole expression. The inner NP is abbreviated.

The overt quantifier and domain already supply a compositional interpretation of *some of the wine*. A silent common noun would need to explain something further, such as a restriction on interpretation or modification that the overt-head account misses. The construction itself supplies no such requirement. I therefore prefer an overt-head analysis over an otherwise equivalent null-head analysis; fusion remains compatible with that preference.

The D-noun analysis treats *some* and *some of the wine* as sharing nominal projection, with an added domain phrase in the partitive. Modification provides a further comparison of internal structure.

4.4 MODIFICATION TESTS THE INTERNAL ANALYSIS

The pair *the lucky survivors/the lucky few* supplies a comparison involving both external determination and adjectival modification. *CGEL* explicitly permits determinatives used as internal modifiers to fuse with Head, as in *the other two* and *these few here* (Huddleston & Pullum, 2002, pp. 415–416). Its analysis of *the few mistakes* assigns *the* to Det and *few* to Mod (Huddleston & Pullum, 2002, p. 392). That dependent use supplies the counterpart for a Mod–Head analysis of independent *few* after an external determiner.

Figure 5 compares the resulting analyses of *the lucky few*. Both have an overt Det and a Nom modified by *lucky*. In the D-noun analysis, *few* fills Head. In the fusion analysis, its DP fills Mod–Head. The competing structure thus uses machinery already needed for adjectival fusion; it requires neither a silent noun nor conversion.

Figure 5: *The lucky few* with ordinary Head (left) and Mod-Head fusion (right). The determiner is separately realized in both. Internal structure within the article phrase and AdjP is suppressed.

Table 3 compares the Head relations across four constructions; §7.2 supplies the rules under both taxonomies.

Table 3: Head and dependent functions under matched analyses. Each independent expression is an NP; *the* fills Det wherever it appears. The ordinary-Head column applies to both taxonomies permitting ordinary determinative heads.

Expression	Separate D with fusion	Ordinary determinative Head
<i>few survivors</i>	<i>few</i> : Det; <i>survivors</i> : Head	Same functions
Independent <i>few</i>	<i>few</i> : Det-Head	<i>few</i> : Head
<i>the lucky few</i>	<i>few</i> : Mod-Head; <i>lucky</i> : Mod	<i>few</i> : Head; <i>lucky</i> : Mod
<i>the idle rich</i>	<i>rich</i> : Mod-Head; <i>idle</i> : Mod	Same fusion and modifier functions

Fusion groups *the lucky few* with *the idle rich*, whereas ordinary headedness groups it with *the lucky survivors*. Ordinary headedness unifies *few* across its bare and externally determined uses, without alternating Det-Head and Mod-Head. Neither account gains coverage from this example alone. The comparison is between sharing a fusion construction across D and adjective, and sharing ordinary nominal headedness across determinative constructions.

Reducing fusion's applications can simplify this description even when fusion remains available for adjectives. The advantage is the uniform treatment of *few*; its value depends on any additional conditions or lost generalizations elsewhere.⁵ Section 7.2 compares those costs while holding the lexical restrictions fixed.

⁵ Compare the theory of second best in Lipsey and Lancaster (1956, pp. 11–12): under a constraint preventing an optimum, satisfying more optimality conditions needn't improve the outcome. The analogy concerns interactions among grammatical choices, not a formal optimum for the grammar.

The constructed *the remaining three* extends the modifier pattern to cardinals. It doesn't independently decide whether *three* is determinative or has a common-noun use: Reynolds (2026) argues for both uses of cardinals. Section 7.3 treats their unification as a consequence conditional on that analysis.

Relative-clause postmodification adds another nominal construction: *those who came*, *anyone who asks*, *everything that matters*, and, with books under discussion, *some that I saw*. CGEL describes relatives with demonstratives and compounds (Huddleston & Pullum, 2002, pp. 414, 422–423). These clauses modify the nominal expression containing the determinative, as they do in *people who came*; their availability isn't limited to compounds.

Number supplies a further distinction between determinatives and adjectives. Independent *this/these* and *that/those* retain overt singular–plural contrasts. The human-class *the rich*, by contrast, is a plural NP whose adjective lacks nominal number inflection and still takes adverb modifiers: *the very rich* (Huddleston & Pullum, 2002, p. 418). The strongest morphological evidence comes from the demonstrative paradigms. The singular and plural specifications of *each* and *several* concern lexical restrictions; NP number alone doesn't distinguish the categories. Other determinatives, such as plural or non-count *some*, remain number-neutral.

Bare colour expressions and evaluative comparative subjects complicate a simple distributional boundary. CGEL's *Henrietta likes red shirts*, and *I like blue* permits colour-noun ambiguity as well as possible reduction licensed by coordination; the attested *Bluer is better* establishes a bare comparative subject without settling its phrase category.⁶ These cases leave the wider comparison of argument distribution and head properties necessary.

The positive comparison therefore combines independent argument use with nominal number properties, partitives and modification. Adjectival constructions provide overlapping external functions while preserving distinct properties of their heads. This favours retaining adjectival fusion alongside ordinary determinative headedness.

4.5 COMPOUNDS AND MODIFIER DOMAINS

A more demanding modifier comparison is *hardly anyone present*. Payne et al. (2007, pp. 581–583) assign *hardly* to DP structure and *present* to nominal structure. The compound *anyone* takes the premodifiers of its determinative base *any*: compare *hardly any writer present*. The adjective realizes a specialized RESTRICTOR function, restricted to post-head position and non-recursive. Figure 6 contrasts this account with an ordinary-Head analysis.

⁶The *blue*, *old* and *small* examples on CGEL p. 417 all occur in coordinated contrasts. *Bluer is better* accompanies a results colour scale in Stanford CS329X, “Codeswitching LLMs”, slide 8 (accessed 10 September 2026). I interpret it as evaluating a degree of blueness. Subject function alone doesn't establish NP status (Huddleston & Pullum, 2002, p. 236).

Figure 6: *Hardly anyone present* with ordinary Head (left) and fusion (right). Both post-head Mod positions realize the specialized restrictor. In the fusion tree, DP fills Det of NP and Head of Nom, following Payne et al. (2007, p. 582, (13d)). Modifier-phrase interiors are suppressed.

In the D-noun analysis, *anyone* inherits nominal projection from Noun and its premodifier permissions from its determinative base. The compound construction supplies the post-head restrictor permission, with the same position and non-recursion conditions as the fusion account. It doesn't license a corresponding pre-head adjective. The compound's ordinary argument use and exclusion of external determination are further lexical conditions; the premodifier and restrictor slots aren't unrestricted Nom dependents.

The relative clauses illustrated above are ordinary postmodifiers, distinct from the specialized restrictor. When both occur, the relative follows it: *something useful that I found*. *CGEL* explicitly gives compounds the common noun's range of ordinary postmodifiers while preserving this ordering condition (Huddleston & Pullum, 2002, p. 423).

This division extends to *someone* and *everybody*: the compound family licenses nominal argument use and post-head restrictors, while each base supplies its own premodifier permissions. It doesn't follow that *hardly* modifies every compound. *CGELBank* attests the post-head pattern in *I need something reliable and good looking*.⁷

Fusion reuses the DP–Nom boundary to separate the two modifier domains. Ordinary headedness reuses nominal projection, locating both domains within Nom and assigning their restrictions to the determinative base and compound construction. Both accounts need the specialized restrictor condition. The trade-off concerns where the restrictions are stated, not whether they can be removed.

4.6 PREDICATIVE USES AND THEIR RESTRICTIONS

The argument-use patterns above don't extend uniformly to predicative complementation. *CGEL* records *Its advantages are several* and *Their enemies were many*, describing the latter pattern as uncommon and formal (Huddleston & Pullum, 2002, pp. 392, 395–396). Predicative use is available to only part of the determinative inventory; *every* and the articles remain excluded from these frames.

The comparison also depends on what the predication expresses. *She is a doctor* ascribes a property, whereas *That is Kim* identifies a person. *CGEL* excludes specifying *be* clauses from its noun–

⁷Sentence `answers-20111024111513AAQhAO_ans-0003` in `ewt-test_iaa50.cgel`.

adjective diagnostic because phrases from other categories occur in them too (Huddleston & Pullum, 2002, p. 536). Merely placing an expression after *be* therefore provides no uniform nounhood test.

Nominal grammar already licenses some expressions predicatively while restricting their argument uses. A bare-role NP such as *president* is licensed in *I'd like to be president*, but requires determination in the corresponding object use *I'd like to meet the president* (Huddleston & Pullum, 2002, p. 328). Predicative and argument uses thus need separate conditions within Noun itself. The determinative asymmetries belong in that comparison; they don't establish exclusion merely by departing from a common-noun substitution frame.

4.7 WHAT THE COMBINED PATTERN SUPPORTS

Independent uses, number, genitives, partitives and modification establish a systematic nominal profile. The properties are distributed across determinative families, just as the existing noun subcategories differ in inflection and dependents. This is the positive basis for extending *CGEL*'s membership rationale beyond pronouns.

Under the D-noun analysis, bare, partitive and externally determined uses inherit the ordinary Head relation of nominal projection. *CGEL* instead relates independent determinatives to dependent counterparts and distinguishes Det–Head from Mod–Head. Its compound analysis also uses the DP–Nom boundary to separate modifier domains. The D-noun analysis states those restrictions within nominal structure (§4.5).

The next two sections consider the hierarchy within Noun and the membership of its restricted forms. Section 7.2 then compares the grammatical organization under the three accounts.

5 COORDINATE SUBCATEGORIES AND INHERITANCE

Should determinatives and pronouns be coordinate subcategories within Noun, or should determinatives belong inside pronoun? Reynolds (2021) compares determinative and pronoun profiles; its matrix contains no common or proper nouns. Distributional separation between the supplied groups doesn't determine their taxonomic rank or test the proposed superordinate category. Even perfect recovery of the distinction would be compatible with shared nounhood. The original discussion likewise leaves a nested nominal analysis open.

The accompanying audit reproduces the published DISCO decomposition, but the clustering outcome varies with initialization and feature selection.⁸

The pronoun inventory in that study follows *CGEL*'s classification, whereas Hudson's pronoun category includes the words he calls determiners. Comparing these hierarchies requires aligning their lexical inventories and asking which generalizations can be stated for each superordinate category.

An intermediate pronoun-plus-determinative category would be useful if it collected generalizations otherwise repeated. Within the proposed grammar, nominal projection rules apply to all four subcategories, so they can be stated for Noun as a whole. The intermediate category would need additional generalizations. Different property profiles alone don't favour coordination: a subtype can differ sharply from the rest of its superordinate category. Core personal pronouns' case, reflexive and person contrasts, and determinatives' quantificational and modifier patterns, support local distinctions under either hierarchy.

⁸The accompanying [Replication audit of the English determinative–pronoun feature matrix](#) documents the discrepancy between the reported 232 features and the public 155-feature file, an extra feature dropped by the published clustering code, and the sensitivity results. The archived public file is retained unchanged.

Reduced descriptive content and contextual interpretation are shared by many pronouns and determinatives. The coordinate analysis can record these interpretive properties through features or cross-classification; they don't by themselves require an intermediate lexical category.

Pro-form gender supplies a more specific interpretive comparison. Reynolds (2025) proposes a personhood-based system spanning pronouns and determinatives. Personal reference links pronouns such as *she* with compound determinatives such as *somebody*; non-personal reference links *it* with *something*. These constraints concern how the referent is construed. They provide a shared generalization for nominal pro-forms, but don't decide between coordinate and nested noun subcategories. The broader pro-form system also includes non-nominal expressions, so gender alone doesn't delimit Noun.

Restrictions on determination and attributive modification provide syntactic candidates, but they also occur outside the proposed grouping. In their primary use, proper names don't select freely from the determiner system, and their adjectival embellishments are restricted (Huddleston & Pullum, 2002, pp. 517, 519–520). These properties distinguish more than pronouns and determinatives from common nouns.

Determination also differs within the proposed intermediate category. Determinatives permit external determination in a range of independent quantificational constructions: *the few*, *the many*, *the two*, *these three*. The permissions vary by item and often require further modification; *CGEL* gives *these few here* and *the many who did* (Huddleston & Pullum, 2002, pp. 415–416). Pronouns admit external determination only marginally, and internal premodification is restricted, as in *poor old me* (Huddleston & Pullum, 2002, pp. 429–430). These restrictions thus cross-cut the proposed grouping and vary within it.

I retain the coordinate classification as a provisional organizational preference. It preserves *CGEL*'s determinative/pronoun distinction while extending nominal structure across both. Hudson's intermediate category would be preferable if further syntactic generalizations over the aligned inventory reduced otherwise repeated restrictions. Section 6 turns from the position of determinative within Noun to the membership of its restricted forms.

6 THE ARTICLES AND OTHER RESTRICTED MEMBERS

Why classify the articles *the* and *a* as nouns if they can't stand independently? Independent uses motivate the D-noun analysis of *some*, *this* and *many*, but the articles require a different argument. *Every* is restricted too, while *no* has the distinct independent form *none* (Huddleston & Pullum, 2002, pp. 371–372, 410–411).⁹

CGEL's treatment of *my* supplies a precedent for restricted membership within Noun (Huddleston & Pullum, 2002, pp. 470–471). The pronoun's paradigm supports its membership despite its lack of *mine*'s independent distribution. For articles, the corresponding positive evidence is integration into determinative; their nounhood depends on the category-level argument.

Retaining a restricted member requires three kinds of support. First, it should be paradigmatically integrated with independently identified members. Second, it should participate in the category's characteristic semantic and grammatical contrasts. Third, its missing uses should form a local restric-

⁹The restriction concerns ordinary argument use. In *the bigger the better*, *CGEL* analyses *the* as a modifier within a comparative phrase (Huddleston & Pullum, 2002, pp. 1131–1132, 1135–1136). This dependent use outside Det leaves the restriction on ordinary argument use intact.

tion while the positive connections remain. Calling an item *DEFECTIVE* summarizes that pattern; it doesn't supply an argument for membership by itself.

The articles meet these conditions within determinative. First, they contrast with demonstratives and quantifiers before common-noun nominals: *the/a/this/every book*. Second, they participate in the same system of definiteness, number and count restrictions: *the* permits singular, plural and non-count targets, while *a* selects a singular count target. Third, their lack of ordinary independent uses leaves that determining pattern intact. These connections support determinative membership, rather than establishing nounhood independently.

Every has further connections beyond the restricted article set proposed by Spinillo (2004). Like *each*, it expresses universal quantification and selects singular count nominals: *every teacher, each teacher*. Unlike *each*, it lacks ordinary independent use. It also permits modification by *almost* and *nearly*. These connections support retaining *every* with the quantifiers.

The argument for retaining the articles is synchronic. Grammaticalization supplies background: C. Lyons (1999, pp. 331–336) discusses the development of definite articles from demonstratives and of articles expressing cardinality from numerals. These histories can explain changes in content and use, but don't establish the synchronic classification.

A separate article category would gain support from a cluster of synchronic restrictions shared by *the*, *a* and *every*, absent elsewhere in Noun, and otherwise requiring repeated exceptions. Lack of independent argument use alone doesn't supply that cluster. The comparison concerns the allocation of generalizations; an additional restriction needn't by itself overturn the membership analysis. All the grammars compared in §7.2 retain the articles' restriction on ordinary argument use.

7 SHARED PROJECTION AND GRAMMATICAL ECONOMY

7.1 A SHARED PHRASE TYPE IN DETERMINER FUNCTION

In *some apples* and *Kim's apples*, the determining phrases share the NP category under both ordinary-Head accounts: D-noun and separate D. *CGEL* instead distinguishes DP from genitive NP. It also admits a restricted range of plain-case NPs and PPs as determiners, as in *what size hat* and *over thirty ties* (Huddleston & Pullum, 2002, Ch. 5, §4). The phrase types are:

CGEL: Det : {DP, NP, PP}

Both ordinary-Head accounts: Det : {NP, PP}

This shares a phrase type without shortening the selectional disjunction: determinative-headed, genitive and other licensed NPs still require separate identification. *CGEL* already states definiteness and the single-Det restriction functionally, so reclassification doesn't derive them. The substantive comparison concerns whether determining phrases reuse nominal projection once their different restrictions are held fixed. Fewer phrase labels alone don't establish grammatical economy; §7.2 displays the rules that must be compared.

7.2 A MATCHED DESCRIPTIVE FRAGMENT

A grammatical *FRAGMENT* is a set of rules for a specified range of constructions. Here it covers determination, ordinary subject and object uses, partitives, and the modifier and compound comparisons in §4. It compares the D-noun analysis with two separate-D alternatives: ordinary headedness

and fusion. All receive the same lexical restrictions and constructed judgments. The predicative constructions in §4.6 fall outside the fragment.

Table 4 records USE PERMISSIONS: whether a form, on a given reading, can head a phrase in determiner, subject or object function. ARGUMENT USE covers the subject and object NPs in examples such as *Some left* and *I saw some*. Quotation, metalinguistic naming and subordinate-clause uses of dependent genitives fall outside the fragment. Noun membership doesn't itself grant a use permission.

Table 4: Shared permissions in the fragment. For *some*, the target column concerns its unstressed use before a noun. The inventory is deliberately limited to the displayed constructions.

Form	Det use	Argument use	Target in the Det construction
<i>the</i>	yes	no	Singular or plural; count or non-count
<i>a, every</i>	yes	no	Singular count nominal
<i>some</i>	yes	yes	Plural count or non-count nominal
<i>few</i>	yes	yes	Plural count nominal
<i>my</i>	yes	no	No number/count restriction in this fragment
<i>she</i>	no	yes	None

Further constructional restrictions apply: *she* is a subject form, whereas the corresponding ordinary object form is *her*. The target restrictions concern the common-noun nominal being determined: *a* requires a singular count target such as *book* in *a book*.

Table 5 locates the three accounts. Comparing the ordinary-Head accounts holds projection fixed while varying taxonomy. Comparing the separate-D accounts holds taxonomy fixed while varying headedness.

Table 5: Three accounts retaining the permissions in Table 4, the modifier restrictions and the compound conditions.

Account	Primary taxonomy	Simple independent determinative
D-noun analysis	D inside Noun	N–Nom–NP projection with Head function
Separate D, ordinary Head	D outside Noun	D–Nom–NP through cross-category projection
CGEL: separate D, fusion	D outside Noun	NP distribution through Det–Head

The D-noun analysis applies nominal projection to determinatives through their membership in Noun. A separate condition checks use permissions. In the schemata below, *h* identifies the lexical head throughout its projection; parentheses mark optional dependents. The subscripts on Mod distinguish pre-head and post-head positions of the same modifier function. The head's entry and

construction restrict every dependent.

$$\begin{aligned} \text{Nom}_h &\rightarrow (\text{Mod}_{\text{pre}}) \quad \text{Head} : \text{N}_h \quad (\text{Comp}) \quad (\text{Mod}_{\text{post}}) \\ \text{NP}_h &\rightarrow (\text{Det}) \quad \text{Head} : \text{Nom}_h \\ \text{licensed}(\text{NP}_h, f, c) &\iff f \in U_h \wedge C_h(f, c) \end{aligned}$$

Here U_h is the head's set of use permissions, f is the NP's function, and C_h checks the lexical and constructional conditions in context c . For Det use, these include compatibility with the target nominal; for an argument headed by a singular count common noun, they include required determination. Optionality in the second rule doesn't override those conditions.

In *some apples*, *some* heads an NP whose Det permission and plural-count target requirement are satisfied. *Apples* heads the outer Nom, which heads the NP. In *Some left*, *some* heads an NP whose argument permission is satisfied. *Every apple* passes the Det and singular-count checks; ordinary independent **Every arrived* fails the argument-permission check. *The apple* and **The arrived* differ in the same way.

Each NP's use permissions follow its own head. In *the apple*, the article's Det permission licenses the dependent NP headed by *the*. The outer NP takes its argument permission from *apple*, whose requirement for determination is satisfied by the article.

A singular count common noun such as *book* faces a different restriction from an article. In *a book*, its requirement for determination is satisfied; bare **Book arrived* leaves that requirement unsatisfied. *Books arrived* has no such requirement. Requiring determination for a common noun doesn't itself block an article-headed NP from argument use. An article's exclusion from argument use must still be stated separately.

Partitives and modifiers require further lexical conditions. *Some* and *few* permit a partitive *of*-phrase within their nominal projection. *Almost* can modify *every* in *almost every teacher*; that permission doesn't license *experienced* as a modifier of *every*. The construction *the lucky few* permits the external determiner and adjectival modifier shown in Figure 5. None of these permissions transfers automatically to every determinative noun.

Keeping ordinary headedness while retaining primary D gives the strongest separate-D alternative. It retains the NP and use-permission rules, but replaces the lexical-head restriction in Nom with:

$$\text{Nom}_h \rightarrow (\text{Mod}_{\text{pre}}) \quad \text{Head} : \{\text{N}_h, \text{D}_h\} \quad (\text{Comp}) \quad (\text{Mod}_{\text{post}})$$

This projection applies to dependent as well as independent determinatives, eliminating DP from the fragment while retaining primary D. Determiner selection still identifies D-headed NPs and suitable genitives. In *the lucky few*, *few* is D in ordinary Head function. In *hardly anyone present*, the determinative base and compound construction supply the same modifier restrictions as the D-noun account. Adjectival Mod–Head fusion remains available in both.

The separate-D fusion account relates independent determinatives to their dependent counterparts. In addition to nominal projection for nouns, it uses DP projection and permits a DP to realize a fused function in nominal structure. The partitive complement and compound restrictor belong to Nom, following the trees in *CGEL* and Payne et al. (2007, p. 582):

$$\begin{aligned} \text{DP}_h &\rightarrow (\text{Mod}_{\text{pre}}) \quad \text{Head} : \text{D}_h \quad (\text{Comp}) \\ \text{Nom}_h &\rightarrow (\text{Mod}_{\text{pre}}) \quad F : \text{DP}_h \quad (\text{Comp}) \quad (\text{Mod}_{\text{post}}) \\ F &\in \{\text{Det–Head}, \text{Mod–Head}\} \end{aligned}$$

The ordinary NP rule embeds this Nom. Det–Head jointly realizes Det of NP and Head of Nom, excluding a second Det; Mod–Head fills an internal modifier’s function and Head of Nom, allowing external determination. Lexical and constructional conditions select the fused function and permitted dependents. These schemata cover independent *few*, *few of them*, *the lucky few* and *hardly anyone present*.

The ordinary-Head accounts thus share nominal projection and Head relations; these benefits don’t uniquely favour inclusion within Noun. Dependent determinatives acquire a Nom layer in both. The taxonomic difference lies in whether the lexical head enters this structure by inheritance from Noun or by a rule admitting both N and D.

A grammar with Hudson’s nested classification can use the same permissions and projection rules. Holding those rules fixed, an added pronoun category between Noun and determinative leaves the fragment’s judgments unchanged. Agreement on these judgments leaves the broader pronoun category open.

7.3 EXISTING RESTRICTIONS, ADDITIONAL COSTS AND CONSEQUENCES

The remaining taxonomic choice is between inheritance through Noun and a projection rule spanning N and D. Separate D preserves the modifier contrast as a primary-category distinction while licensing nominal projection across that boundary. D-noun makes projection an inherited property and states the modifier contrast within Noun.

The cost of this change needs separating from restrictions already present in the grammar. Common nouns, proper nouns and pronouns already differ in determination and permitted modifiers (Table 2). Preserving those conditions is no additional cost of including determinatives. Likewise, the separate-D grammar already restricts adverbial modification and independent use within D. Moving those restrictions inside Noun doesn’t create them.

Payne et al. (2010, p. 75, n. 3) analyse *almost* as a modifier of the attributive noun *textbook* in *an almost textbook case*. The D-noun analysis extends such premodification to a systematic noun subcategory, including *hardly any* and *almost every*. Its cost is stating the usual modifier contrast at that subcategory boundary. In compounds, the inherited premodifier permissions must also be distinguished from the post-head restrictor construction (§4.5).

Why should systematic nominal projection warrant inclusion for pronouns but require cross-category licensing for determinatives? I favour placing the recurring external and structural profile at Noun, with modifier and use restrictions at the subcategories and constructions that distinguish them. This applies the existing membership rationale consistently.

The comparison can be extended by fixing the same inventory, constructions and readings for both grammars, then asking which additional rules each needs after common restrictions have been factored out. Inheritance gains support if further constructions reuse nominal rules that an independently motivated D-specific analysis has to state separately. Separate D gains support if its boundary captures recurring structural restrictions that inclusion in Noun has to restate across constructions. Counting independent uses alone doesn’t settle this: either grammar can state the same permissions positively or as exceptions.

Cardinals illustrate a consequence of broadening Noun. Reynolds (2026) distinguishes determinative uses such as *ten men*, proper-noun uses such as *Room 101*, and common-noun uses such as *tens of pens*. Under the D-noun analysis, these uses fall within one superordinate category, with their differences retained at the subcategory and construction levels. This recasts the cardinal alternation

without eliminating it. The argument doesn't extend to ordinals, which that study analyses as adjectives, or turn complex numeral phrases into single lexemes.

Complex cardinals also separate category from function. In *two hundred books*, the whole *two hundred* fills Det; internally, *two* modifies the magnitude head *hundred* (Reynolds, 2026, §4). In *these two hundred books*, *these* fills Det and *two hundred* is an internal modifier. Including determinatives within Noun preserves these relations. One Det function doesn't entail a limit of one determinative lexeme per NP.

If determinative-headed and genitive expressions require different projection rules after their independently motivated restrictions are held fixed, the shared-projection proposal in §7.1 loses its advantage. That would favour separate phrase types. Retaining a separate primary D requires the further case that the category boundary captures the recurring differences better than a determinative subcategory within Noun.

8 CONCLUSION

The comparisons support including determinative within Noun in English. Across independent uses, partitives and modification, the analysis gives determinatives shared nominal structure while retaining their lexical and constructional restrictions, including those of the articles. *CGEL* already admits pronouns on comparable grounds despite differences in inflection and dependents. The D-noun analysis extends that membership rationale.

Within Noun, coordination remains provisional: the fragment's judgments don't distinguish it from Hudson's nesting. An intermediate category would be preferable if it captured further generalizations otherwise repeated.

Through membership in Noun, determinatives inherit the Head relations that unify their bare, partitive and externally determined uses. A separate-D grammar can also license that projection. The taxonomic choice concerns inheritance through Noun versus cross-category licensing. I favour inheritance because it extends *CGEL*'s rationale for pronoun membership, with the modifier contrast stated within Noun. Shared nominal structure belongs at the superordinate category; differing permissions remain at subcategory and construction levels.

DATA AND ANALYSIS MATERIALS
