

Claim register: participation claims by diagnostic, lexeme, status, and basis

Brett Reynolds

Supplementary material, September 2026

1 WHAT THIS REGISTER IS

This supplement records participation claims identified in the census of 14 September 2026, with subsequent amendments, by diagnostic and lexeme, with the claim's status (licensed, conditional, excluded) and the basis the article gives for it at that point in the text. It exists so that the comparison in §2 of *Determinatives as nouns in English* can be inspected: for each diagnostic, which lexemes the article treats as showing the property, which as excluded, and on what evidence. It is a register of what the article asserts, not an independent survey of English, and it doesn't assess whether any claim is correct.

2 HOW IT WAS MADE

A census of the article's sentences was produced on 14 September 2026 by a language model (Aristotle, Harmonic) reading each section and recording claims that an expression participates in a construction, with an exact quotation: 658 claims across all 28 sections, every quotation an exact substring of the source, and ten withheld acceptance cases all reached. The census is model-identified: the acceptance cases and the keyed claims below test recall of known claims and agreement of labels, not the rate of omitted or spurious claims, which no human audit has estimated. Each claim was then labelled with a diagnostic from a 22-item catalogue by Claude Haiku 4.5 in two passes; against 51 claims with an independent key, the label was reproduced for 44. A second model (TypeSafe jev-1.13.0) labelled all 658 claims independently on 16 September 2026; on the 250 claims where it reported confidence of 0.8 or above, it agrees with the current labels on 235. The basis of each claim is the article's own: an attestation footnote, a starred form, or a citation at the sentence, and otherwise the census's reading of the sentence. Since the census, 9 claims have been withdrawn with the sentences they quoted (listed with the reasons in `amendments.json`), leaving 649. Of these, 135 are classed as taxonomic or methodological rather than constructional, 9 are labelled only "other", and a further 79 have no resolvable lexeme (98 more lexeme-less claims fall in the first two classes); the register covers the remaining 426 claims as 440 claim–lexeme pairs, since a claim that names two lexemes appears once under each. The quotation check tests the recorded wording against the current article. It detects wording changes, but doesn't detect new or omitted claims; the register isn't an exhaustive inventory of the current draft. Files, scripts, and model outputs are in the project repository under `analysis/manuscript-census-2026-09-14/`.

The labels are model-assigned, with explicit corrections recorded in `amendments.json`; the key covers a twelfth of the claims, so a row is a pointer to the sentences it counts, not a verdict. The sections column gives the article sections to read.

3 COVERAGE BY DIAGNOSTIC

Table [1](#) gives, for each diagnostic, the number of lexemes of each subcategory with a claim, and in parentheses how many of them are claimed licensed or conditional / excluded only.

Table 1: Lexemes with a claim, by diagnostic and subcategory; in parentheses, licensed or conditional / excluded only. The first two columns state whether the property is general, restricted, or absent for English common nouns and for adjectives (fused-head uses and the article’s quantificational-adjective controls included), each cell sourced to *CCEL* or to the article in *analysis/typicality.json*; a question mark marks a cell for which no source was located. Blocks group functions and constructions (§2.4), nominal connections (§§2.1 and 2.3), the adjectival profile (§2.2), and structural analysis (§4); within a block, rows run from the properties that most favour Noun (general for nouns, absent for adjectives) to those that most favour Adjective, with unsourced rows last. Subcategory columns follow Table 2 of the article, with the adjective controls, which lie outside Noun, last.

Diagnostic	of common nouns	of adjec- tives	common noun	proper noun	pronoun	determ.	adjective (control)	total
<i>Functions and constructional range</i>								
Det before a nominal	general	absent	2 (2/o)	2 (2/o)	3 (1/2)	16 (16/o)		23
